

Humans

Homo sapiens

What they do

Opposable thumbs and large brains allow humans to look at the underneath of leaves to look for signs of damage by insects or other pests and remove the cause of the damage.

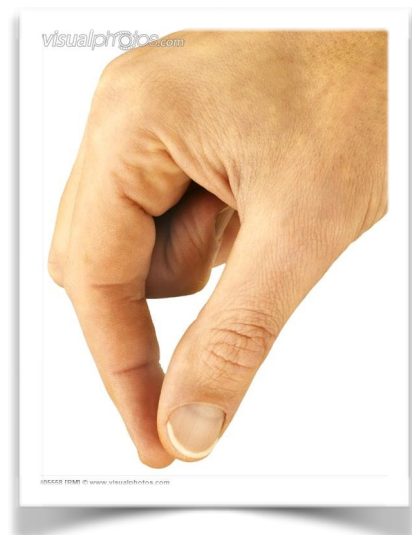

These abilities allow for humans to handpick pests or damaged leaves from plants, set traps to catch slaters or snails and to spray non-or low-toxic sprays.

What to look for:

Spending time in the garden looking for damage to leaves gives humans a chance to see if they should set a snail or slater trap or to handpick caterpillars off leaves.

How to attract them

Edible plants, delicious fruit and pretty flowers can attract humans, though in some areas they are in plague proportions and are using an unfair amount of resources compared to others.

Slaters trapped by hiding in half an orange-green life soil co
